

SCRUF-D

ARCHITECTURE

1. Computed Recommendations :

- Description : Recommendation list, ls , generated for each user/contact.

- Attributes :

item_name
item_id
item_rating
item_predicted_rating
item_tag-1
item_tag-2
item_tag-n
item_rank
user_id
user_profile_tag-1
user_profile_tag-2
:
user_profile_tag-n
time_stamp

list $\rightarrow ls$

↓
list $\rightarrow w_j$

map

- Functions :

store_ls_DB
store_wj_DB

- $U(u) \rightarrow$ users

- $V(v) \rightarrow$ items

- $\phi = \langle \phi_1, \dots, \phi_k \rangle \rightarrow$ Item features

- $w = \langle w_1, \dots, w_j \rangle \rightarrow$ user profile

- $\phi^s \subseteq \phi \rightarrow$ sensitive item features

- $w^s \subseteq w \rightarrow$ sensitive user features

- $R_i(w, v) \rightarrow \{v, \hat{r}\} \rightarrow$ predicted rating $\hat{r} \in R_r$

- $L = \{v_1, \hat{r}_1, \dots, v_i, \hat{r}_i\}$

- $\text{sort}(R_i(w, v)) \rightarrow l_s$

2. Database (DB)

- Description : Stores all the generated lists & historical data
- NoSql

All the lists to be stored :

- l_s : recommendation list generated by the recommender system. (with item attributes & user profile key)
- w_j : user profile list generated by the recommender system (with key to l_s)
- f_i : $m \times c$ of each fairness agent : Table 1
- R_i / l_r : predicted ratings : Table 2
- f_i^* : m, c & β values for each fairness agent : Table 3
- \vec{H} : Allocation History
- \vec{L} : Choice History
- l_c : final recommended list.

3. Fairness Agents

- Description : These agents are associated with specific fairness concerns, assessing different aspects of the item, users and the I.S.

- Attributes:

agent_name
 agent_fairness_type
 agent_fairness_logic
 agent_fairness_side
 agent_fairness_label
 agent_fairness_score
 agent_fairness_compatibility_user_id
 agent_fairness_preference_item_id
 historical_lp
 agent_predicted_rating - R_i

- Functions:

evaluate_m_score
 evaluate_compatibility_agent_user
 evaluate_preference_score_item
 generate_lp
 evaluate_historical_state
 measure_historical_efficacy
 evaluate_protection_tag
 evaluate_efficacy

- $\tilde{F} = \{f_1, \dots, f_i\} \rightarrow$ set of fairness agents
- $f_i = \{m_i, c_i, R_i\} \rightarrow$ fairness agent i , $m_i =$ fairness metric, $c_i =$ compatibility metric, $R_i =$ Ranking function
- efficacy : $\bar{p} \rightarrow$ desired recommendation for proposed $\rightarrow 0.5$

$$P_* \rightarrow \frac{\# \text{ items protected appeared}}{\# \text{ rec given}}$$

$$\min \left(1 - \frac{\bar{p} - P_*}{\bar{p}} \right)$$

- m_score : (librec - auto) : difference in exposure of the protected (vs) unprotected items.
 $[m_i(\vec{L}, \vec{H}) \rightarrow [0, 1]]$

* $\vec{L} \rightarrow$ choice history
 * $\vec{H} \rightarrow$ allocation history

0 \rightarrow minimally fair
 1 \rightarrow very fair

$$(*) \frac{\sum \text{protected item in } l_{s/p/c}}{\text{total items in } l_{s/p/c}} - \frac{\sum \text{unprotected items in } l_{s/p/c}}{\text{total items in } l_{s/p/c}}$$

\rightarrow define a l_s distribution

\rightarrow define a l_p distribution

\rightarrow define a l_c distribution

\rightarrow evaluate distance between 2 distributions.

- $C^o(w)$ \rightarrow considers 1 || Experiment with Bossiness.

- $R_i(w, v)$ $\rightarrow \{v, \hat{p}\}$ || Fairness agent's Recommendation function

- $l_p = \{R_1(w, v), \dots, R_i(w, v)\}$ || Set of fairness agent recommendation lists, indexed by fairness label, i .

		m c					
f_i	f_1			v_1	\hat{p}_{11}	\hat{p}_{12}	\hat{p}_{13}
	f_2			v_2	\hat{p}_{21}		
	f_3			v_3		\hat{p}_{32}	

Table 1

R_i

Table 2

$l_{s,1}$

4. Allocation Mechanism

- Description : Determines which fairmen agents will be active in responding to a given recommendation opportunity. (Comparing the agent valuations of both the current system fairness & compatibility)

• Attributes

set_of_fairmen_agents \mathcal{F}
 agent_fairness_metric_evaluation
 agent_compatibility_evaluation

• Functions

agent_allocation (\mathcal{A})
 format_allocation_history (\vec{H})

→ for user w_j at time t

	m	C	β
f_1			
f_2			
f_3			
f_i^*			

Table 3

→ agent_allocation

- probability distribution over the fairmen agents interpreted as weights.

$$\mathcal{A}(\mathcal{F}, m_j(\vec{L}, \vec{H}), c_{\mathcal{F}}(w)) \rightarrow \beta \in \mathbb{R}_+^{|\mathcal{F}|}$$

→ allocation_history (\vec{H})

- ordered list of agent allocations \mathcal{A} at time t .

• Allocation History :

$$\vec{H} = \langle \beta^1, \dots, \beta^t \rangle$$

5. Choice Mechanism

- Description: The set of allocated agents S their preferences (S weights) are combined with the current user, u to form the final recommendation list, l_c

Attributes:

→ agent - preference - score
 recommendation - list - l_s
 agent - allocation - β
 recommendation - list - l_r
 → agent - ranking - function —

Functions:

evaluate - recommendation - list - l_c
 format - choice - history - Γ

	P_{f_1}	P_{f_2}	...	P_{f_n}		f_1	f_2	f_3	...	R_i^o Table 2		m	C	β	Table 3
v_1					v_1	\hat{p}_{11}	\hat{p}_{12}	\hat{p}_{13}			f_1				
v_2					v_2	\hat{p}_{21}					f_2				
v_3					v_3		\hat{p}_{32}				f_3				

Preference

Ranking

why do we need both?

- Choice Function :

- Each fairness agent expresses preferences over set of items for a particular user

$$\underline{R_i(u, v) \rightarrow \{v, p\}}$$

- $l_p = \{R_1(u, v), \dots, R_i(u, v)\}$

- β used as either
 $\left[\begin{array}{l} \text{lottery} \\ \text{weighting Scheme} \end{array} \right.$

- Choice History :

$$\vec{l} < l^b, l_p^t, l_c^t >$$
